

<p><b>Topic</b></p>	<p><b>The Knobe Effect in Human-Robot Interactions – An investigation of intentionality attributions</b></p>
<p><b>Overview</b></p> 	<p>Ethical and moral considerations in regard to human-robot interactions are getting increasingly important as service robots are becoming more and more part of our everyday lives.</p> <p>Studies on human-human interactions have shown that moral evaluations can influence intentionality judgments. Against this background, we want to investigate the <b>Knobe effect</b>.</p> <p>The Knobe effect describes a human perception where the goodness or badness of an action influences peoples' <b>intentionality attributions asymmetrically</b>; bad outcomes are judged as intentional, whereas good outcomes are judged as unintentional (Feltz, 2007).</p> <p><b>Does such an asymmetry in the way we ascribe intentional actions exist in human-robot interactions?</b></p> <p>In particular, we attempt to answer the following questions:</p> <ul style="list-style-type: none"> <li>• What exactly is the Knobe effect and how does it affect intentionality attributions?</li> <li>• How is intentionality and morality connected?</li> <li>• How was the Knobe effect measured in previous research?</li> <li>• Why is the Knobe effect important in human-robot interaction?</li> <li>• What psychological mechanisms can explain these effects?</li> </ul> <p>The various questions should be answered within the scope of a literature review, the development of an online survey and data analysis of survey data.</p> <p>Exemplary literature:</p> <ul style="list-style-type: none"> <li>• Feltz, A. (2007). The Knobe effect: A brief overview. <i>The Journal of Mind and Behavior</i>, 265-277.</li> <li>• Nichols, S., &amp; Ulatowski, J. (2007). Intuitions and individual differences: The Knobe effect revisited. <i>Mind &amp; Language</i>, 22(4), 346-365.</li> </ul>
<p><b>Language</b></p>	<ul style="list-style-type: none"> <li>• English preferred</li> </ul>
<p><b>Additional information</b></p>	<p>Start: flexible; as agreed upon with supervisor Type of work: Bachelor or Master thesis</p>

	Requirements: interest in topics on the interface between humans and robots Main subject: Psychology or business students preferred
